I have reviewed these X Rays dated 20 October 2020

### Radiographic findings:

There is there is mild modelling of the proximal left intermediate carpal bone. This represents a low risk.

There is a small boney non articular fragment on the latero dorsal margin of the right hind distal cannon (fetlock). This finding is of little or no clinical significance.

There were no other significant radiographic changes noted.

### **Endoscopic Examination and opinion thereof:**

An endoscopic examination of the laryngopharyngeal area was performed at rest. The arytenoids were synchronous in their movements and full abduction was easily achieved (Lane Grade I). This finding is within normal limits. No abnormalities were noted and the horse complies with Para 3.6 of the 2020 RTR conditions of sale
